

ABSTRACT OF THE DISCLOSURE

A rotary belt sterilizer comprises, a drive roller (21, 22) arranged to rotate in synchronization with running of a sterilized rotary belt (A). An applicator roller for the sterilizing solution (61) is configured to apply a sterilizing solution to the sterilized rotary belt (A). A switching device for applicator roller is arranged to contact the applicator roller (61) with the sterilized rotary belt (A) during rotations of the drive roller (21, 22) and separate the applicator roller (61) from the sterilized rotary belt (A) during halts of the drive roller (21, 22). A supply tray (60) for the sterilizing solution is arranged to supply the sterilizing solution to the applicator roller (61). A sterilizing solution supplier is arranged to supply the sterilizing solution to the supply tray from a storage tank (65) for the sterilizing solution per pre-determined rotations of the drive roller (21, 22).
